

Kenlm makes it difficult to access the words in its vocabulary so first run:

```
getVocabOfEachFileInDir.py <in_directory> <out_directory>
```

This will generate a vocabulary for each file in the in_directory and save them too out_directory with the suffix "-Vocab.json"

then run the test script:

```
python testKenlmModel.py <model> <vocab_file>
```

This will print the probability of word one sentence at a time in an array
